Sequence 2, Application US/09232468A
Patent No. 6207165
GENERAL INFORMATION:
APPLICANT: AUDONNET et al.
TITLE OF INVENTION: POLYNUCLEOTIDE VACCINE FORMULA AGAINST PORCINE
TITLE OF INVENTION: REPRODUCTIVE AND RESPIRATORY PATHOLOGIES
FILE REFERENCE: 454313-2230
CURRENT APPLICATION NUMBER: US/09/232,468A
CURRENT FILING DATE: 1999-01-05
NUMBER OF SEQ ID NOS: 54
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 2
LENGTH: 913
TYPE: PRT
ORGANISM: Pseudorables virus

The method comprises administering an immunogenic amount of Pisalmonis specific antigen termed OspA, or an immunogenic fragment of particularly poikilothermic fish, against the bacterial pathogen pathogen method is also useful for protecting animals, rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents optimised P. salmonis OspA protein 17E2 (AAP66247) has been optimised for expression in Ecsherichia coli. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. Salmonis specific antigen termed OspA, or an immunogenic amount of a OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents the amino acid sequence of C17E2, a P. salmonid construct optimised for expression in Escherichia coli, fused to an undefined N-terminal fusion partner. The fusion protein is used in a vaccine to create an anti-OspA antibody response.

The method comprises administering an immunogenic amount of a p. salmonis specific antigen termed OspA, or an immunogenic fragment of ospA in the form of a vaccine. The method is used for protecting animal particularly poikilothermic fish, against the bacterial pathogen p. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRR) and other rickettsial diseases. The preses sequence represents P. salmonis ospA protein. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis

This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a particularly poikilothermic fish, against the bacterial pathogen of a particularly poikilothermic fish, against the bacterial pathogen rickettsial septicaemia (SRS) and other rickettsial septicaemia (SRS) and other rickettsial diseases. The presents an immunogenic epitope of the P. salmonis ospanic poitope of the P. salmonis ospanic protecting against salmonid protein. The peptide is used to raise rabbit anti-Ospa antibodies.

The present sequence is that of BASB113 protein from Moraxella cattarrhalis strain Mc3931 (ATCC 43617), a causative agent of otitis media in children and pneumonia in adults. The invention provides BASB113 polypeptides, and polynucleotides encoding them, as well as expression vectors, host cells and methods for producing BASB113 polypeptides using recombinant methods. Also claimed is a vaccine composition comprising a BASB113 polypeptide, an immunogenic
                                                                                                         Claim 1; Page 67; 86pp; English.

AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAX94318 to AAX91802 to AAX91899 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can

The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.

                                       The PBOMP proteins were isolated from a PBOMP-enriched insoluble cell wall fraction from physically disrupted cells of H. influenzae and then solubilising the PBOMP from the cell wall fraction by heating in the presence of a detergent or digesting the cell wall fraction with lysozyme, opt. in the presence of a detergent. The genes encoding the PBOMP proteins were isolated by screening a DNA library with an oligonucleotide probe based on the amino acid sequence of the PBOMP protein, or using antibodies to PBOMP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.

The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polynucleotides are also used in diagnostics as expressed sequence tags (CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or impartitating a polypeptide in tissue, as molecular weight markers and as consisted and polynucleotide sequences are useful in medical continuity of sites expressing (II). (I) and (II) are useful in medical continuity of sites expressing (II). (I) and (II) are useful in medical continuity of the polypeptide and polynucleotide sequences have applications in the produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent normal mutations continuity and sequence data for this patent did not appear in the printed context of the sequence data for this patent did not appear in the printed context of the sequence of the invention.
                                                                                                                               Query Match
                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 10

acid for

The present sequence is that of the orb-weaver spider (Nephila Clavipes) recombinant silk protein pETNoDS. The invention Structural proteins. Organic acids are used to lyse recombinant CC cells or other biological samples (such as non-recombinant) proteins. Organic acids are used to lyse recombinant CC derived cells), and enrich the purity and yields of structural proteins intact. In the case of silk proteins, the structural proteins intact. In the case of silk proteins, the chromatography and processed into an aqueous-based mixture for CC into metography and processed into an aqueous-based mixture for CC into vector pET24 for recombinant expression in Escherichia coli, CC containing denaturant (3 M guanidine-HCl) and by affinity content organic or not in such protein was obtained using formic acid methods of the invention can be used in the construction of many combinant protection, parachutes and parachute cords. The new CC method has the following advantages over prior art: it involves contents, requires less time and smaller volumes of reagents,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Вb
                                                                                                Matches
                                                                                                                       Query Match
                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGITA), expressed DNA sequences (ABLIGITA) and the encoded proteins (ABBIGITA).
                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published pct sequences

                                                                                                                                                                                              are disclosed, together with the nucleic acids encoding them. In all, cytoplasmic proteins, secreted proteins or other cellular proteins, vaccines containing the nucleic acids or proteins are claimed, as are probes containing the nucleic acids or proteins are claimed, as are sequences. The vaccines are useful for treating or reducing the risk of detecting the process of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                        Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all,
